01 / Project Proposal

PRELIMINARY REVIEW | 10 NOVEMBER 2026 | DRAFT

What we propose

ClassroomCast is a locally hosted classroom screen-sharing and access-control system. A teacher shares a selected screen and supported audio to admitted students in web browsers. Authorized administrators manage network restriction profiles through the application and an approved local enforcement service.

Problem to validate with the teacher

Students may struggle to read demonstrations on a distant projector. Internet-dependent sharing can interrupt lessons when WAN service is unavailable. Teachers need simple class admission and participation controls; network staff need a consistent way to apply, verify and restore temporary restrictions. These are proposed problem statements, not measured research findings.

Objectives and evidence

Objective	Evidence expected later
Readable live demonstrations	Screen and supported-audio demonstration on agreed devices and browsers.
Controlled classroom access	Valid admission succeeds; rejected, removed and unauthorized viewers cannot receive media.
Local operation	New browser session joins and views with WAN disconnected after local provisioning.
Safe network controls	Approved policy blocks a test domain, permits an exception, preserves ClassroomCast and restores only its own changes.
Realistic capacity	Staged load tests with physical and simulated clients reported separately. Teacher-specified target: 50-150 students; CN06 validates capacity for 150.

Current stage

Requirements and design drafts exist; the earlier course-board screenshot reported 0 of 24 tasks completed; verify current completion from task evidence. Documents and diagrams are planning evidence, not evidence of working software or approved requirements.

01 / Project Proposal / continued

PRELIMINARY REVIEW | 10 NOVEMBER 2026 | DRAFT

Scope for discussion

Category	Proposed treatment
Required classroom behavior	Create class, local URL/QR and join code, admission and roster controls, screen/supported audio, pause/resume/stop, connection feedback and recovery.
Required network behavior	Approved profiles, scoped authorization, application/verification, expiry, emergency recovery and safe restoration. Feasibility depends on network-owner permission.
Deployment obligations	Campus and portable modes remain in the source specification. School-server hosting does not automatically remove portable scope.
Lower priorities	Materials/downloads, identity entry and scheduling/configuration transfer are Should items; history, optional interaction and group targeting are Could items.
Proposed exclusions	Custom SFU development and universal control of unmanaged devices are not proposed release commitments. Confirm exclusions with the teacher.

Resources and feasibility

Five CodeHub members will deliver the project. Confirm actual weekly hours, server specifications, access points, test laptops, certificate trust and authorized DNS/gateway integration. Budget and equipment availability are not yet established. Test local HTTPS, one publisher/two viewers, offline operation and apply/restore on an authorized test network before committing to scale.

Schedule and approval requested

The latest supplied site plan uses preparation November 10-17, design November 18-27 and three development sprints November 30-January 13. Earlier files use six sprints starting November 2; those are historical planning drafts. The editing cutoff previously shown was January 25, 2027 at 23:59, while the site plans release January 27 and presentation February 3. Confirm which deliverables each date governs.

Requested decisions: problem and scope, acceptance test conditions, deployment equipment, infrastructure authority, three-sprint schedule and review milestones. All decisions remain pending until recorded.

Source: v2 proposal, scope, feasibility and risk documents; original supplied specification; latest user-provided course-board screenshots. Submitted PDF originals were unavailable at the named Downloads paths.
