02 / Requirements Summary

PRELIMINARY REVIEW | 10 NOVEMBER 2026 | DRAFT

Users and permissions

Role	Responsibility and boundary
Teacher (TCH)	Create and manage own classes, publish screen/audio, manage participants and select assigned approved profiles. No automatic network-administration permission.
Student (STU)	Request admission, watch authorized media, adjust personal playback and reconnect. Cannot publish teacher media or change policies.
System Administrator (SYS)	Manage application accounts/settings and assigned policy profiles within explicit permissions. No automatic classroom viewing or network-wide authority.
IT / Network Administrator (NET)	Configure approved integrations, manage assigned network scopes, verify enforcement and recover failures. Infrastructure-owner authorization remains necessary.

Six product areas

Area	Included capability groups
Broadcasting	Screen capture, supported audio, quality controls and playback.
Classroom participation	Class creation, join information, admission, roster and participant access.
Network access control	Profiles, rules, exceptions, apply/verify and restoration.
Deployment / infrastructure	Campus and portable preparation, local services and connectivity.
Diagnostics / recovery	Status, reconnect, emergency/expiry and unresolved-operation recovery.
Administration / security	Scoped authorization, secrets, minimal logs and administrative settings.

Inventory: 63 original numbered requirements and 68 feature cards, organized into 15 use cases and 18 process flows. These counts are different views of the system, not 68 completed features.

02 / Requirements Summary / continued

Priority and status

The original numbered register contains 31 Must, 7 Should, 3 Could and 22 deployment obligations with no individual priority label. The latter are not automatically optional; proposed Must classification needs agreement. Green = Must; yellow = Should; gray = Could; red = proposed exclusion; white = context or unresolved decision. Color never means implemented or tested.

Rules that the implementation must preserve

Rule	Expected behavior
Admission is separate from viewing	A join code or pending request does not grant media access. Final admission checks current class, eligibility, blocking and capacity.
Class and media are separate	Pause/stop broadcast leaves the class open. A new source after capture ends requires fresh browser consent.
Policy state is explicit	Saved profile, accepted apply request and verified client-path enforcement are distinct.
End class safely	Close admission, revoke grants and verify media closure. Record restoration independently; unknown restoration is never reported as success.
Recover safely	Resume unfinished operations without repeating completed changes. Restore only ClassroomCast-owned changes; preserve unrelated administration changes.

Acceptance candidates - not test results

Agree a browser/OS/audio matrix and physical-device capacity. Existing drafts propose 720p/15 fps, p95 screen latency at most 1 second, 30-minute staged load tests, and healthy-network apply/restore within 30 seconds. These are proposed targets, not approved promises or measured results. Security tests must reject unauthorized viewing/control and prevent removed users from reconnecting.

Decisions needed first

Agree test conditions for the teacher-specified 50–150 students; equipment for campus and portable deployment; code-only versus teacher approval; student identity and block persistence; pause/audio behavior; network authority; and continuation without verified restrictions (D05).
